

Feature Tree Model

Introduction

A **Feature Tree Diagram (FTD)** is a visual representation that breaks down a system, product, or application into its hierarchical set of features and sub-features. Unlike a system flow diagram, which emphasizes data flow and interactions, a feature tree focuses on **functionality, capabilities, and feature dependencies**. It helps stakeholders, product owners, and developers understand what the system can do, how features relate, and how they are organized.

Feature tree diagrams are ideal for:

- Representing all features and sub-features of a system or product
 - Showing hierarchical relationships and dependencies between functionalities
 - Supporting product planning, prioritization, and scope definition
 - Communicating capabilities to technical and non-technical audiences
-

Diagram Components

Features: Key capabilities or functionalities of the system, typically represented as the main branches of the tree.

Sub-Features: Secondary or dependent functionalities that expand on the main feature, forming the branches of the tree.

Hierarchy/Levels: Levels of decomposition showing how features are broken down into finer, implementable parts.

Dependencies: Optional annotations or arrows to show relationships between features that are not strictly parent-child.

Grouping/Modules: Logical grouping of related features to simplify understanding and highlight modularity.

Modeling Symbol Definitions

- **Rectangles/Boxes:** Represent features or sub-features. Larger boxes may represent higher-level capabilities, smaller boxes represent sub-features.
- **Lines/Branches:** Connect parent features to child features, showing hierarchical decomposition.
- **Colors/Icons:** Optional visual aids to indicate feature categories, status, or importance.

- **Dashed Lines:** Optional notation for optional or conditional features.
-

Diagram Example

Feature Tree Diagram – Power Platform Applications

- **Power Platform**
 - **Power Apps**
 - Canvas Apps
 - Model-driven Apps
 - Portal Apps
 - **Power Automate**
 - Desktop Flows
 - Cloud Flows
 - AI Builder Automation
 - **Power BI**
 - Reports
 - Dashboards
 - Dataflows
 - **Power Virtual Agents**
 - Chatbots
 - Channels
 - Analytics

This hierarchy shows major platforms as top-level features, with each sub-feature representing a functional capability within that platform. Additional optional branches can illustrate integrations with Microsoft 365, Azure, and external services.
